

Maci

Cancer Screening in a Dog at High Risk of Cancer Yields Peace of Mind

7-year-old | Female Spayed | Rottweiler | 90 lbs

ONCOK9[®] by PetDx[®]

Presentation

USE CASE

Screening

- ✓ Age 7 and Older
- ✓ High-Risk Breed

CLINICAL DETAILS

Maci presented for a routine wellness visit. She had no clinical signs and her physical exam was unremarkable.

WHY ONCOK9 WAS PERFORMED

Maci had no signs of cancer. However, three of her housemates as well as her owner were recently diagnosed with cancer, and the family was understandably concerned about the possibility of Maci having cancer. Her family requested OncoK9 to screen for cancer during her wellness and preventive care evaluation.

OncoK9[®] Result

CANCER SIGNAL

NOT DETECTED

- A *Cancer Signal Not Detected* result significantly reduces the likelihood that cancer is present, but does not rule out the presence of cancer or the possibility of cancer developing in the future.
- If cancer is clinically suspected, a full diagnostic evaluation should be performed.

Findings & Plan

- No current suspicion of cancer on wellness exam, and the OncoK9 result was *Cancer Signal Not Detected*. This significantly reduces the likelihood of Maci having cancer at this time.
- No further workup was required.
- The *Cancer Signal Not Detected* result provided peace of mind for Maci's family and veterinarian, and they plan to repeat OncoK9 at her annual wellness visit next year, so that if cancer develops, it has a higher chance of being caught early.

Case Takeaways/Outcome

VETERINARIAN

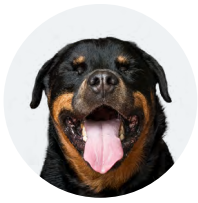

The OncoK9 test enhanced the annual wellness workup and enabled the veterinarian to address a "cancer worrier" pet parent's request for comprehensive cancer screening in a high-risk patient.

OWNER

The test provided peace of mind after recent experiences with cancer in the family.

PATIENT

The test provided a good baseline screen for cancer, with a simple blood draw. Maci's family plans to continue annual testing so that if cancer develops, it has a higher chance of being caught early.
